

2 As the water gets hotter, use your spatula to gently stir the mixture, but watch out for hot splashes! If you are nervous, ask an adult to help with this part. Soon the sugar will begin to disappear, but keep stirring.

3 Heat the sugary water for around three minutes. You want the water to be very hot, but not boiling; if bubbles rise to the water's surface, turn the heat down. After a few minutes, you should have a syrupy liquid. Turn off the heat.

4 While your solution cools down, add some food coloring to it. Around 10 drops is enough, so drip it in slowly and carefully. Slice the lemon in half and squeeze a little of the juice into the mixture, to add a zingy flavor. Stir again.

You can
make several
lollipops with
this amount
of liquid.

The sugar granules provide a perfect surface for the crystals to grow on.

5 Meanwhile, wet one half of a wooden skewer with water, then plunge it into the remaining sugar. This leaves a coating of sugar granules clinging to the skewer that will help your crystals to grow. You will need one skewer for every lollipop.

6 After 10 minutes, the solution should be cool enough to pour into your glass. Wait longer if you're not sure, because very hot liquid could crack the glass. If you want to make more than one lollipop, add small amounts of solution to more glasses.
