

CELLS, VOLTAGE, AND BATTERIES

One lemon with a coin and a screw in it is one "cell." A single cell produces some electricity, but not with enough energy to light an LED. Energy is measured in volts (V), and a single lemon cell produces about 0.8V. To produce a high enough voltage to light the LED, you need to join five lemon cells together. Multiple cells joined together are called a battery.

Copper wire has metal inside and connects the coins with the screws.
