

A close-up photograph of a handcrafted DNA double helix model. The model is constructed from strips of paper and tape. The two sugar-phosphate backbones are represented by wide, glossy blue ribbons that spiral around each other. The nitrogenous base pairs, or rungs of the ladder, are made from thinner strips of paper in various colors: green, yellow, orange, pink, and red. These rungs connect the two blue ribbons. The model is set against a solid purple background. Two text annotations with arrows are present: one at the top left pointing to a rung, and another at the bottom right pointing to a rung.

A snazzy DNA spiral would look good decorating your bedroom.

Use tape to fix the rungs of the ladder in place.
