

Make sure you put rubber bands at different angles to cover the paper ball completely.

All the planets revolve around the sun in the same direction.

Earth is the only known planet to have living things.

3 Make Venus with one piece of paper and yellow and red rubber bands. Venus is reddish-brown, with a rocky surface hidden underneath layers of yellowish-white clouds made of toxic gases.

4 Here comes our own planet, Earth. It is about the same size as Venus, so again needs only one piece of paper. Use lots of blue rubber bands to represent oceans, and some green ones for land.

You could use brown rubber bands, too, if you have some.

5 Now we've reached Mars, which is about half the size of Earth. Make a paper ball from half a piece of paper and use red bands. Mars is known as "the Red Planet" due to the red dust that covers it.

6 Next is the largest planet in the solar system, Jupiter. Make the ball with six pieces of paper. Use red, yellow, and white bands to imitate the colorful stripes of Jupiter's dense atmosphere.
