

HOW TO MAKE A STURDY BRIDGE

Take your time making this bridge: the more accurately you put the pieces together, and the more time you allow the glue to set, the stronger the finished result will be. Put down some newspaper first, as the glue can get messy. Also, make sure you have enough space to put completed sections of the bridge to one side while you make the other sections.

WHAT YOU NEED

Press the sticks together, and leave them for a minute for the glue to dry.

1 Start by making one side of the bridge. First glue the ends of three popsicle sticks together to make an equilateral triangle—so all three sides are the same length, and all three angles are equal.

You should end up with a triangle on the end of a line of sticks.

2 Dab glue onto the end of another stick, then press one corner of the triangle on top. Add two more sticks in a line, each under the one before it.

Glue together the ends of the sticks to form another triangle.

3 Glue two more sticks into an equilateral triangle on the next stick in the line. Repeat twice more to give you four triangles in a line.
