

a question; research your question; form a hypothesis; test your hypothesis through experimentation; analyze the data; draw a conclusion; and communicate your results. Scientists use this method every day in their labs to discover ways to design safer cars, cure diseases, and make our food healthier and tastier. It's the method I used when I made a sensor to detect cancer and a water filter that uses recycled plastic water bottles. I wonder what YOU are going to use it for!

Using this book, you will be able not only to read about science, but also to get practical, hands-on experience. We young scientists have to start somewhere, and this book will help you begin finding out for yourself the answers to questions about food science, how DNA works, and how paper airplanes fly, among others. As a young scientist, you can start by asking "Why?" And by making messes, making mistakes, and making connections.

Maker Lab contains great experiments for beginning scientists, and with it you can start on your journey to discovering the wonders and the whys of science. Using what you've learned from these experiments, you can begin to imagine what YOU can do to solve problems in your community and change the world for the better.
