

Make sure you don't squash the straw when you wrap tape around it.

3 Now cut off the ends of both red balloons. In your model, the balloons will represent the lungs. They will take in air and let it out again, inflating and deflating inside the bottle as if breathing in and breathing out.

4 Push the end of one straw about $\frac{3}{4}$ in (2cm) inside a balloon. Wrap tape firmly around the balloon, making an airtight joint. Now repeat with the other balloon and another straw. These straws represent branching air tubes called bronchi.

This end of the straw represents the air passage at the back of your throat.

5 Cut a slit $\frac{3}{4}$ in (2cm) up the middle of one end of the third straw—the trachea—so that it opens up into two equal parts. Do the same at the other end, then turn the straw 90 degrees and cut it again, so this end opens into four equal parts.

A person
breathes in and
out about **seven
million times**
every year.

6 Push the two straws (the bronchi) with the two balloons attached (the lungs) over the ends of each half of the two-way split straw (the trachea). Finally, secure them with masking tape.
