

Quick quiz

What is the Sun made of?

What is a total solar eclipse?

Which part of the Sun is the hottest?

Swirling loops

Gigantic loops of glowing gas shoot out from the surface of the Sun into space. They can last for months.

In the center

The center, or core, is the hottest part of the Sun. This is where the gases produce energy. The energy takes 100,000 years to reach the Sun's surface.

The temperature at the Sun's core is 27 million °F (15 million °C).

Sizzling surface

Bubbles of hot gas make the Sun's surface appear grainy. You should never look at the Sun, though. Its light is so bright, it can damage your eyes.
