

# What makes a car go?

Most cars are powered by an engine that uses gasoline or diesel, which are liquid fuels. The car's engine burns this fuel to move a system of rods and cogs, which turn the car's wheels and make it go.

**Electric cars don't use gas, but run on battery power using an electric motor.**

## Quick quiz

Which fuels power most cars?

What does a gearbox do?

What does a drive shaft connect to?

*Reverse gear turns the wheels backward.*
