

Quick quiz

- ★ How does a submarine dive?
- ★ How do submarines use sonar?
- ★ How was the Turtle sub powered?

The first submarine

The Turtle submarine was built nearly 250 years ago. It was made of wood and had a tank at the bottom to allow it to dive and rise. The Turtle was powered by one man; he turned a handle to spin the propeller.

In control

The control room is the heart of the sub. The crew operates everything from here.

Fully armed

The submarine carries weapons. It can launch 16 missiles at once.

Submarines move faster under water than they do on the surface.

Finding its way

When a submarine is under water, it uses sound waves called sonar to find its way around and locate objects, such as enemy submarines.

Rise and dive...

The sub has a tank near the front and one at the back (shown in blue). These are filled with water to make the sub dive, or air to make it rise.
