

What's inside my body?

Your body is made up of trillions of tiny living things called cells. They combine to form tissues, including muscles and nerves. Groups of tissues working together make organs, such as your brain and heart.

Control center

You need your brain to move and think. Without it, the rest of your body could do nothing at all.

Wobble box

When air from your breath passes over your larynx (or voice box), the cords inside it wobble. This makes sounds, allowing you to speak.

Deep breaths

When you breathe in, your lungs take in oxygen from the air. When you breathe out, they get rid of the waste gas you don't need.

Quick quiz

-  Which body part produces sound?
-  What is your heart used for?
-  Where in your body is your urine stored?

Pumping blood

Your heart is a pump that sends blood around your body in one direction. It beats day and night without stopping.
