

We have

about the same
number of hairs
on our body as
a chimpanzee.

Food

processor.....

Your liver is like a mini factory: It takes the food you eat, separates the good parts from the bad, then sends them to the right parts of your body.

Food collector.....

Your stomach is a bag made of muscle. The stomach lining makes chemicals that break down your food, so your body gets the nutrients it needs.

A look at cells

Cells are microscopic, but without them you would not even exist. There are many different types of cell that make up parts of your body, such as blood, bones, muscles, and fat.

A fat cell shown 250 times its size and colored purple.

Waste

disposal

Your bladder stores urine, which contains waste your body needs to get rid of. It gets bigger as it fills up, then empties when you go to the bathroom.....

:Coiled tube

Your small intestine takes the goodness from your food and passes it into your blood so that it can travel around your body.
