

How many bones are in my body?

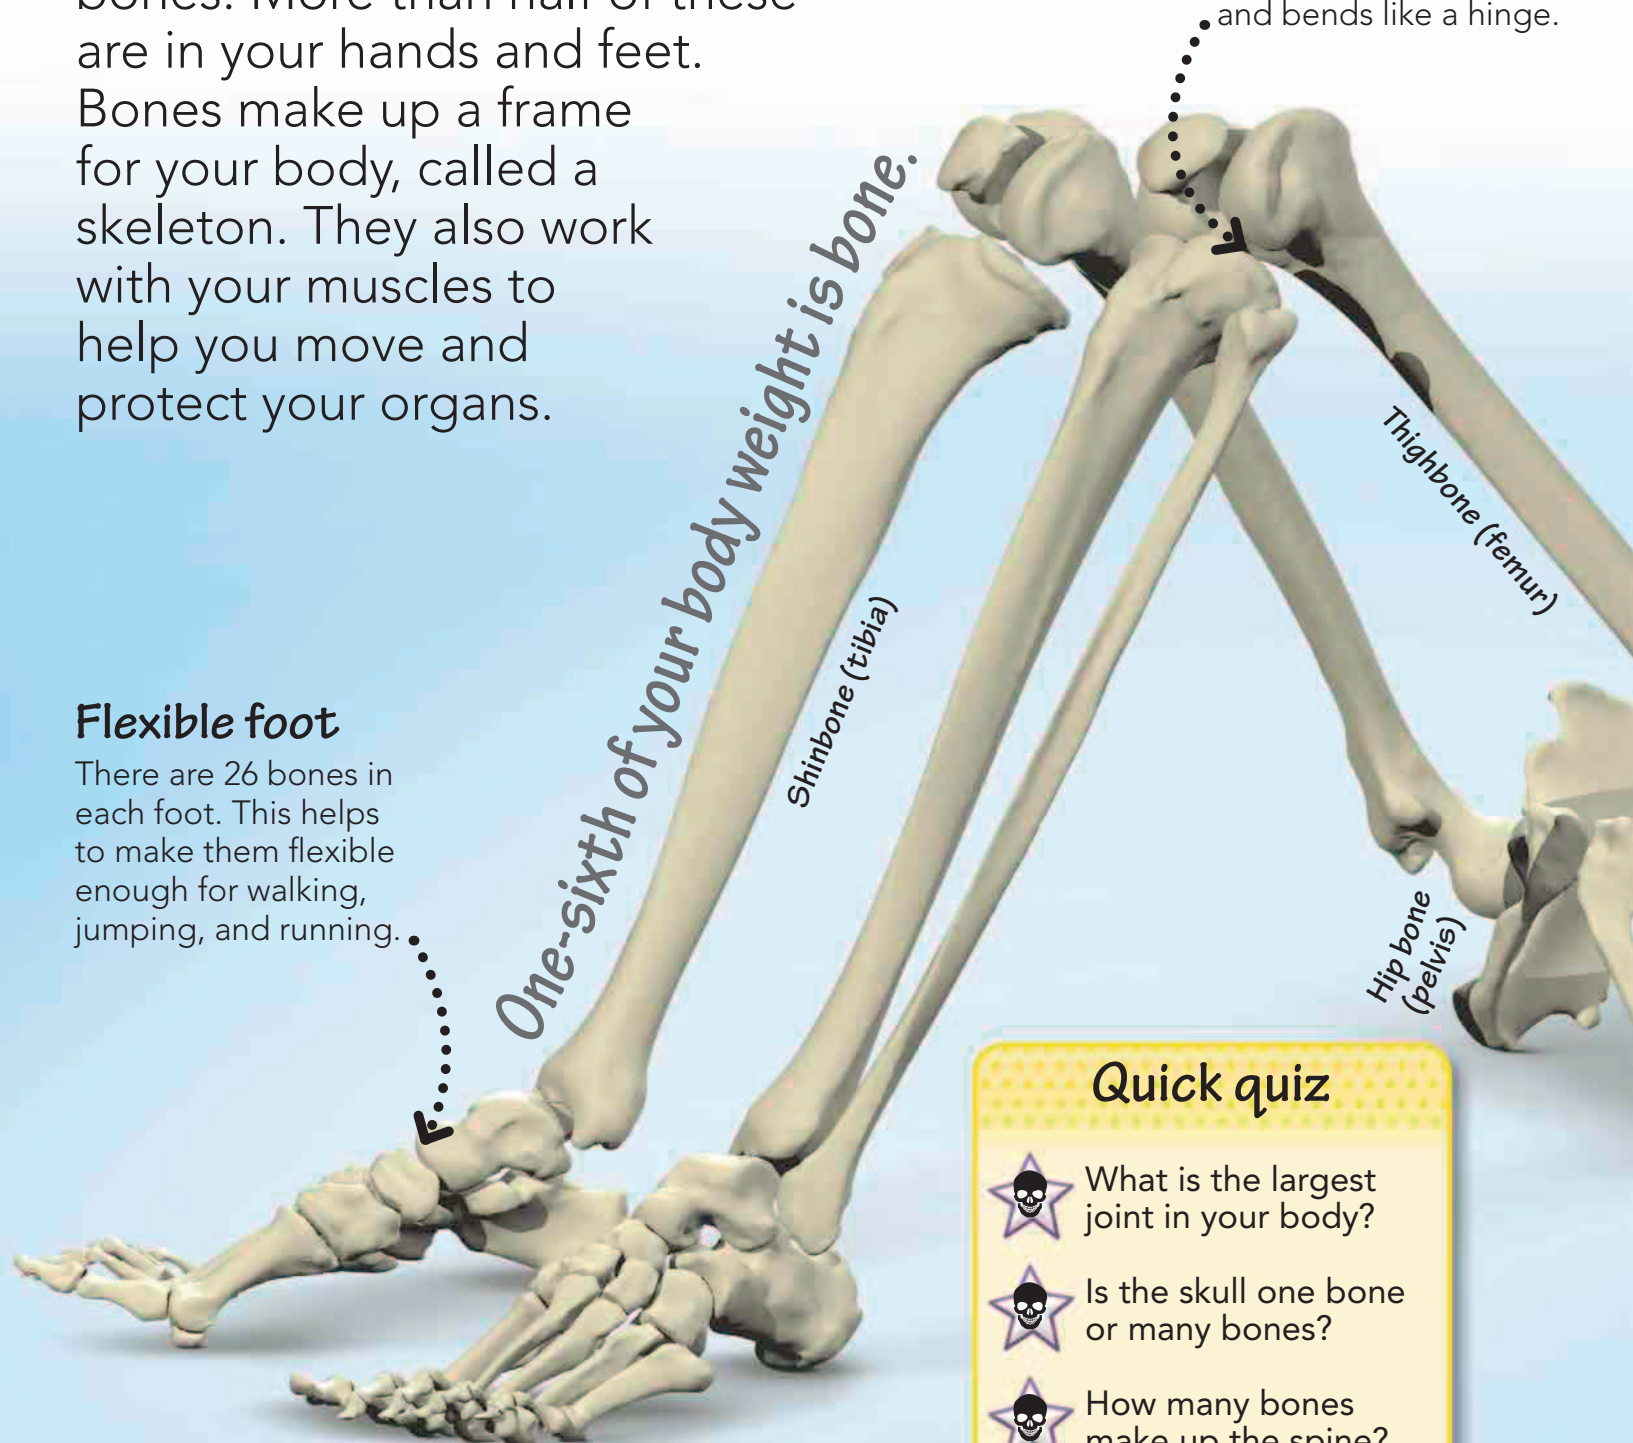

The human body contains 206 bones. More than half of these are in your hands and feet. Bones make up a frame for your body, called a skeleton. They also work with your muscles to help you move and protect your organs.

Flexible foot

There are 26 bones in each foot. This helps to make them flexible enough for walking, jumping, and running.

Hinged at the knees

The place where two bones meet is called a joint. The knee is the largest joint in your body and bends like a hinge.

Quick quiz

What is the largest joint in your body?

Is the skull one bone or many bones?

How many bones make up the spine?
