

Your **biggest muscle** is in your bottom. It is called the **gluteus maximus**.

Tough tendons

Your muscles are attached to your bones by tendons. They look like thin cords and are very strong.

② Straightening

When your triceps muscle contracts (gets shorter and thicker), it pulls your lower arm away from your shoulder.

Triceps

Pull-not-push pairs

Your body has more than 640 muscles that help you move. Like your biceps and triceps, these muscles can pull but cannot push, so they work in pairs that pull in opposite directions. For example, to move your foot, a muscle in your shin pulls it up, while a muscle at the back of your calf pulls it back down again.
