

Just jelly!

Your eye is a squishy ball filled with a jellylike liquid. This liquid helps it to keep its round shape.

Light detection

The retina is a layer of light-sensitive cells at the back of your eye. When light hits the cells, they send messages to your brain.

Topsy turvy

The lens bends the light so everything we see is upside down. Our brain turns it the right way around again.

Roll your eyes

Six muscles move your eyeball, so you can look from side to side and up and down.

Your five senses

Humans have five senses: sight, hearing, smell, touch, and taste. Senses work together to help you understand the world.

See

Hear

Smell

Touch

Taste

To the brain

Your optic nerve carries light signals to your brain.

Quick quiz

What is the colored part of your eye called?

Where is your pupil?

How do light signals reach your brain?
