

Outside the Earth

The Earth is surrounded by layers of gases, called the atmosphere. These protect the planet from the Sun's rays and give us the air we need to breathe.

The Earth was formed 4.5 billion years ago.

What's inside the Earth?

Planet Earth is a giant rocky ball spinning in space. We live on its thin outer layer, called the crust, but there are more layers on the inside. At the very center is a hot, solid, metal core.
