

Unusual mammals

There are around 5,000 different types of mammal. A few are unusual, because they don't give birth to fully developed babies.

Duck-billed platypus

This mammal lays eggs. When the babies hatch, they feed on their mother's milk.

Kangaroo

Newborn kangaroos grow inside their mother's pouch. They feed on their mother's milk until they are strong enough to live outside the pouch.

Sharp teeth

Lions and other meat-eating mammals have pointed teeth for gripping and killing prey and sharp teeth for slicing up meat.

...Hard to spot

The lions' sandy-colored fur coats blend in with the dry grass. This helps them to creep up on prey. Female lions hunt together to chase down animals, such as zebras.

Only male lions have a thick shaggy mane of long hair.

...Raising families

Female lions, like most mammals, give birth to live babies and produce milk for feeding their young. These lion cubs will drink milk from their mother's teats for the first few months of their lives.
