

Scaly skin

All snakes have dry skin covered in scales. These help them to glide over the ground and provide grip to climb trees.

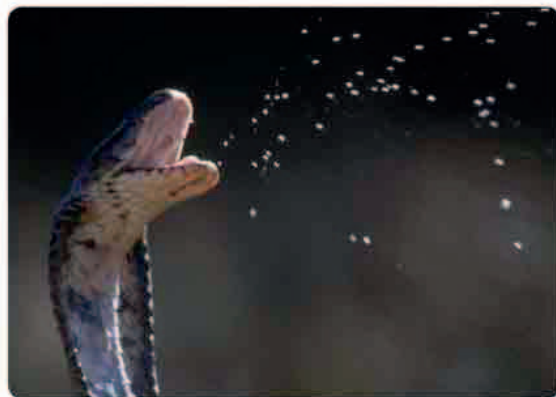

Skinny insides

The snake's stomach and other organs are long and thin to fit inside its body. The stomach stretches to help it digest large prey.

Spitting snakes

Many snakes kill their prey by biting them with their venomous fangs. Some kinds of cobra can spray venom up to 10 ft (3 m) to scare off enemies.

One deadly bite from an Australian inland taipan contains enough venom to kill 100 people.
