

Quick quiz

What is a spider's exoskeleton?

How do tarantulas poison their prey?

How many legs do spiders have?

...Gripping claws

A tarantula has a pair of claws at the end of each leg that it uses to grip when climbing.

Catching prey

Many spiders trap flying insects by spinning a web made from strong silk threads. The spider then wraps its prey in sticky threads so that it can't move. Spiders can't eat solid food, so they inject their prey with special juices. These turn their meal into a liquid, which the spiders then suck up.

Fearsome fangs . . .

Tarantulas have two large fangs that inject venom (poison) into their prey. They feed mainly on insects, but also eat mice, frogs, small lizards, and snakes.

.....Bendy legs

All spiders have eight legs and each leg has six joints. This makes them very nimble.
