

Small, tough leaves can stand up to the cold weather.

Green all year

Needle-leaved trees, such as pines and firs, are known as coniferous because they make seeds inside cones. They are also called evergreens because they keep their leaves in winter.

The world's biggest leaves belong to palm trees. Raffia palm leaves can grow to 20 m (65 ft).

Give us a hand

A palm tree's canopy – its branches and leaves – looks like a hand, with the leaves spreading out like fingers. There are more than 3000 species of palm, mostly found in tropical places.
