

Antimatter

Hydrogen's antimatter counterpart is called antihydrogen. It is made of an antiproton containing two up antiquarks and one down antiquark, orbited by a positron.

Annihilation

When a particle collides with its antiparticle counterpart, they annihilate, resulting in pure energy in the form of gauge bosons.

PHOTONS PRODUCED

The electron and positron annihilate each other, producing two photons with the same energy held by the particles before the collision.
