

TYING IT TOGETHER

M-theory unifies five versions of string theory—which allow different types of strings—into a single theory. M-theory proposes fundamental building blocks called “branes,” which are multi-dimensional versions of one-dimensional vibrating strings. The theory requires 11 dimensions (ten of space and one of time), and seven of them are “curled up” so small that they are invisible to us living in the other four dimensions. String theories, including M-theory, have been criticized for being possibly unfalsifiable.

6D CROSS SECTION

.....
This image depicts the cross section of a 6D Calabi-Yau manifold.

HIDDEN DIMENSIONS

.....
Most dimensions could be imperceivable due to being “curled up” on themselves.

Calabi-Yau manifold

It is proposed that the extra dimensions of string theory are curled-up complex multidimensional space, such as this Calabi-Yau manifold.
