

ROSE CATEGORIES

Grown for the extraordinary beauty of their flowers, roses have been in cultivation for hundreds of years. They have been widely hybridized, producing a vast number of shrubs suitable for growing as specimen plants, in the border, as hedges and as climbers for training on walls, pergolas and pillars. Many are remountant (with flowers in successive flushes), some flower continually. Roses are classified into three main groups:

SPECIES

Species, or wild, roses and **species hybrids**, which share most of the characteristics of the parent species, bear flowers generally in one flush in summer and hips in fall.

OLD GARDEN ROSES

Roses in this category flower mostly in summer (in warm climates even in spring), some continuing to flower into winter. Almost all have fragrant flowers.

Alba—large, freely branching roses with clusters of flowers and abundant, grayish-green foliage.

Bourbon—open, remountant shrub roses that may be trained to climb. Flowers are often three to a cluster.

China—remountant shrubs with flowers borne singly or in clusters, sometimes throughout winter.

Damask—open shrubs bearing loose clusters of usually very fragrant flowers mainly in summer.

Gallica—fairly dense shrubs producing richly colored flowers, often three to a cluster.

Hybrid Perpetual—vigorous, remountant shrubs with flowers borne singly or in threes.

Moss—often lax shrubs with a furry, mosslike growth on stems and calyx. Some are remountant.

Noisette—remountant climbing roses that bear large clusters of flowers, with a slight spicy fragrance. Provide shelter; some flower during winter.

Portland—upright, rather dense, remountant shrubs bearing loose clusters of flowers.

Provence (Centifolia)—lax, thorny shrubs bearing scented flowers.

Sempervirens—semievergreen climbing roses that bear numerous, fragrant flowers in late summer.

Tea—remountant shrubs and climbers with elegant, pointed buds that open to loose flowers with a spicy fragrance. Provide shelter; some flower during winter.

MODERN GARDEN ROSES

Shrub—a diverse group, many with similar characteristics to Old Garden roses. Most are remountant and larger than bush roses, with flowers borne singly or in sprays in summer and/or fall.

Hybrid Tea—remountant shrubs with large flowers borne in summer–fall.

Floribunda—remountant shrubs with usually large sprays of flowers in summer–fall.

Dwarf clustered-flowered bush (Patio)—neat, remountant shrubs with sprays of flowers in summer–fall.

Miniature bush—very small, remountant shrubs with sprays of tiny flowers in summer–fall.

Polyantha—tough, compact, remountant shrubs with many small flowers in summer–fall.

Groundcover—trailing and spreading roses, some flowering in summer only, others remountant, flowering in summer–fall.

Climbing—vigorous climbing roses, diverse in growth and flower, some flowering in summer only, others remountant, flowering in summer–fall.

Rambler—vigorous climbing roses with flexible stems that bear clusters of flowers mostly in summer.

FLOWER SHAPES

With the mass hybridization that has occurred in recent years, roses have been developed to produce plants with a wide variety of characteristics, in particular different forms of flowers, often with a strong fragrance. These flower types, illustrated below, give a general indication of the shape of the flower at its perfect state (which in some cases may be before it has opened fully). Growing conditions may affect the form of the flower. Flowers may be single (4–7 petals), semi-double (8–14 petals), double (15–30 petals) or fully double (more than 30 petals).

Flat—open, usually single or semidouble flowers have petals that are almost flat.

Cupped—open, single to fully double flowers have petals curving outward gently from the center.

Pointed—elegant, 'Hybrid Tea' shape; semidouble to fully double flowers have high, tight centers.

Urn-shaped—classic, curved, flat-topped, semidouble to fully double flowers are of 'Hybrid Tea' type.

Rounded—usually double or fully double flowers have even-sized, overlapping petals that form a bowl-shaped or rounded outline.

Rosette—usually double or fully double flowers are rather flat with many muddled, slightly overlapping petals of uneven size.

Quartered-rosette—rather flat, usually double or fully double flowers have muddled petals of uneven size arranged in a quartered pattern.

Pompon—small, rounded, double or fully double flowers, usually borne in clusters, have masses of small petals.

WHITE

R. 'Penelope'

Dense, Hybrid Musk rose with plentiful, dark green foliage. Bears clusters of many scented, cupped to flat, semidouble, pink-cream flowers, 3in (8cm) across, in summer–fall. **H** and **S** 3ft (1m), more if lightly pruned.

☀️ ♂ Z6–9

R. 'Madame Hardy'

Vigorous, upright Damask rose with plentiful, leathery, matte leaves. Richly fragrant, quartered-rosette, fully double flowers, 3in (7cm) across, white with green eyes, are borne in a single flush in summer. **H** 5ft (1.5m), **S** 4ft (1.2m).

☀️ ♂ Z4–9

R. JACQUELINE DU PRÉ ('Harwanna')

Vigorous Shrub rose with glossy, dark green leaves. In summer–fall, bears cupped, semidouble, red-stamened, ivory flowers, 4in (10cm) across, with palest pink petal-backs and a strong musk perfume. Repeat flowering. **H** 4ft (1.2m), **S** 3ft (1m).

☀️ ♂ Z5–9
