

IRISES

Few other perennials show such diversity of flower color as irises; and you will find one for almost every position in the garden. They have a long flowering season, the earliest appearing in the first months of the year, the latest in early fall. Their flowers often have “beards” (short hairs) or crests that add to their appeal, while a few are grown for their foliage or seed heads. The genus is classified into many divisions. Of these, the easiest to grow are the bearded, crested, and Xiphium irises. Siberian and Japanese types are ideal for bog gardens or watersides, but they will tolerate drier sites. Juno, Oncocylus and Regelia irises are more difficult to grow, though their beautiful flowers are worth the effort. For more information, see the Plant Dictionary.

I. 'Ringo' ① [bearded]

I. ensata 'Rose Queen' ① [bearded]

I. japonica ① [Evensia]

I. 'Bold Print' ① [bearded]

I. hoogiana ① [Regelia]

I. confusa ① [crested]
