

GINGERS

Gingers have been cultivated in Europe for more than 100 years and bring colorful, intricate flowers, tropical foliage, and, quite literally, spice to the garden. Evergreen types need to be overwintered under glass or gradually dried off in fall to induce artificial dormancy, whereas many deciduous types, such as *Roscoeia* and *Cautleya*, will die off naturally and, being frost hardy, can remain in the ground with a protective mulch. Most gingers do not tolerate wet winter conditions and benefit from some shade. A brighter location encourages flowering, whereas shade encourages better foliage, so site accordingly. They should not be allowed to dry out while in growth, and are heavy feeders, so give them frequent applications of liquid feed.

Alpinia zerumbet

Hedychium densiflorum

Hedychium stenopetalum

Hedychium yunnanense

Hedychium thyrsoforme

Costus speciosus

Curcuma petiolata

Alpinia purpurata

Curcuma zedoaria

Roscoeia scillifolia

Kaempferia pulchra

Hedychium densiflorum

Globba winitii

Hedychium maximum
