

Acer triflorum

Slow-growing, deciduous, spreading tree with peeling, gray-brown bark. Leaves, composed of 3 leaflets, are dark green, turning brilliant orange-red in fall. Clusters of tiny, yellow-green flowers appear in late spring.

☀️ 💧 Z5-7

Malus 'Professor Sprenger'

Deciduous, rounded, dense tree. Dark green leaves turn yellow in late fall. White flowers, pink in bud, open from mid- to late spring and are followed by orange-red crabapples in fall.

☀️ 💧 Z4-8

Malus 'John Downie'

Deciduous tree, narrow and upright when young, conical when mature. White flowers, borne amid bright green foliage in late spring, are followed by large, edible, red-flushed, orange crabapples in fall.

☀️ 💧 Z5-8

SORBUS

Comprising more than 100 hardy species, *Sorbus* includes a wide range of ornamental trees ideal for small to medium-sized gardens. They provide year-round color and interest, with fragrant corymbs of cream flowers, attractive, divided foliage, vibrant fall color, and decorative berrylike fruits that last well into winter on some species. Most members of this genus fall into one of two categories: the Aucuparia group, which has pinnate leaves, like European mountain ash (*Sorbus aucuparia*), and the Aria group, which has rounded or ovate leaves, such as whitebeam (*Sorbus aria*). Virtually all species are easy to grow and thrive in full sun or dappled shade, and in well-drained, fertile, acidic or alkaline soil, although species within the Aucuparia group are not long-lived on shallow alkaline soils.
