

Icebergs

Giant blocks of frozen ice float through the coldest waters on Earth. They were once attached to glaciers or ice sheets, but these icebergs have broken off and drifted away, in a process called calving. Most icebergs are found in Antarctica and the North Atlantic Ocean.

Tabular icebergs
always have a flat
top and steep sides.

Islands of ice

A piece of ice must measure more than 100 ft (30 m) wide and 16 ft (5 m) above sea level to be called an iceberg. The biggest icebergs can be as large as a small country!
