

Icebergs are shaped by crashing waves and collisions with land or other icebergs.

The largest part of an iceberg is hidden underwater.

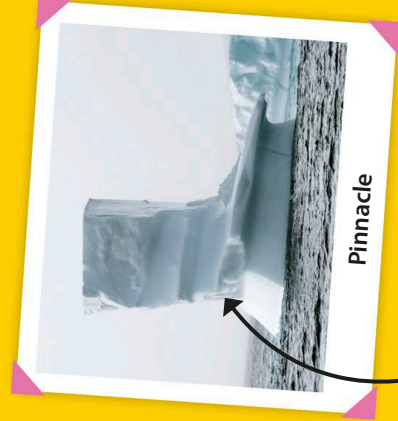

Iceberg types

Icebergs are grouped together by shape. Tabular icebergs are the most common, but nontabular types can be many different shapes.

An iceberg with a slope on one side and a steep cliff on the other is called a wedge.

Wedge

Pinnacle

This type of iceberg has at least one tall column.

U-shaped

An iceberg may be eroded (gradually worn away) over time to form an arch.
