

Ribbon eels

This predator looks like a colorful ribbon when swimming through the water. Its nostrils detect the vibrations of nearby fish, then the eel moves in to catch its prey with strong jaws and sharp teeth.

JELLYFISH

These deadly hunters are found all over the world. Anything that comes into contact with their long tentacles receives a poisonous sting. This paralyzes prey (stops it from moving), which is then ready for the jellyfish to eat.

Blacktip sharks

Swimming along tropical coastlines and coral reefs, these sharks find strength in numbers. They hunt in small groups to increase their threat, before they sink their jagged teeth into their prey with ease.
