

Dive and steer

Seals dive deep underwater. Their two front flippers are used for steering, while two back flippers propel the seal forward.

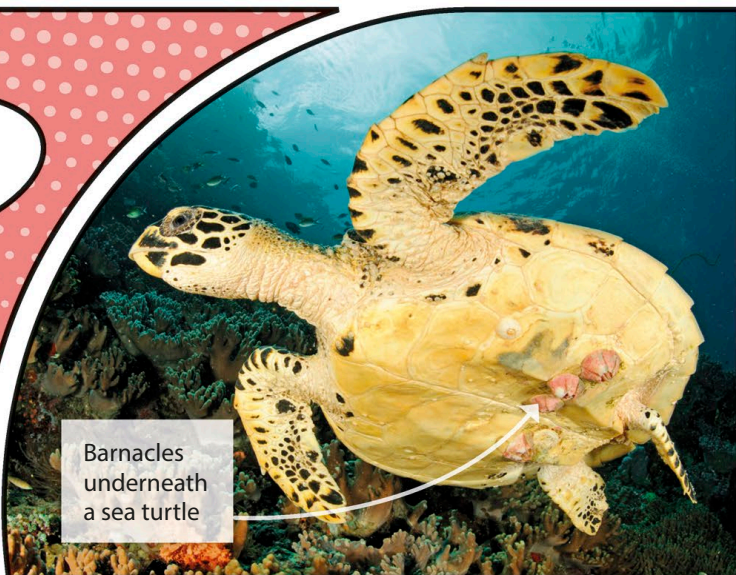

Jet propulsion

Jellyfish move using jet propulsion. They open and squeeze their bodies to blast out jets of water and move in the right direction.

Leap

Dolphins are graceful swimmers. Sometimes, they use their torpedo-shaped bodies to build up enough speed to leap out of the water.

Hitch a ride

Baby barnacles pick a spot and attach themselves to it forever. This could be a rock, a boat, or even a passing sea turtle!
