The volcanic islands of Galápagos

Galápagos

Known for their unique wildlife, the 21 volcanic islands of Galápagos formed from a hot spot in the East Pacific Ocean. The youngest volcanoes on the Fernandina and Isabela islands are still erupting.

Réunion

This island formed over a hot spot in the Indian Ocean about 5 million years ago. One of the volcanoes on Réunion Island, Piton de la Fournaise, erupts regularly.

The moai statues of Easter Island

Easter Island

Easter Island was formed from a hot spot in the Pacific Ocean about 750,000 years ago. This island is 1,100 miles (1,700 km) away from its closest neighbor. Ancient Polynesians used the volcanic rock on the island to create human-figure statues, called moai.
