

Great white shark

Narwhal

Head

Most sharks, whales, and dolphins have rounded, streamlined heads. The great white shark is easily recognized by its huge jaws and sharp teeth, which are ready to tear into prey.

Horn

At home in Arctic waters, the narwhal stands out among other sea mammals because it has a large, swordlike horn. This horn is really a long tooth, which detects changes in the surroundings.

Bryde's whale

Underbelly

Whales are covered in a layer of blubber (fat) up to 6 in (15 cm) thick. Their underbellies hold huge amounts of food, and have more than one stomach to digest it.

Whopper whale

The biggest animal on Earth is the blue whale. Measuring up to 100 ft (30 m) long and weighing 165 tons (150 tonnes), this mighty mammal has a heart the same size as a small car.
