

AUV Artemis is designed to examine polar ice.

Autonomous underwater vehicles

Robots that travel underwater without a human driver are called autonomous underwater vehicles (AUVs). They are programmed on land before being sent on special missions to collect scientific data from the oceans.

Research ships

New research vessels are being designed to conduct studies at sea. These large ships are stocked with essential tools for specific investigations, such as studying underwater rocks, offshore oil rigs, polar ice, or animals of the deep.

Research ship *Neil Armstrong* is named after the first man on the moon.

Snorkelers can discover marine life close to the water's surface.

Snorkeling

Simple snorkeling equipment has made it possible for anyone to see marine life wherever they choose to swim. The mask gives a clear view underwater, while the tube stretches above the surface so that the snorkeler can breathe.
