

Ocean supplies

The image shows three large, white, three-bladed wind turbines standing in the ocean. The turbines are positioned diagonally from the bottom left towards the top right. The blades are long and thin, and the towers are thick and cylindrical. The ocean is a deep blue with some whitecaps, and the sky is a clear blue with scattered white clouds. The turbines are mounted on dark, rectangular bases that sit on the ocean floor.

Oceans support the lives of people all around the world, and provide opportunities for transportation and trade. Their waters are full of natural resources, and food and ingredients for medicines can be found beneath the waves. Fossil fuels, such as oil and gas, lie under the ocean floor.

Propellerlike blades
are turned by the
power of the wind.

A black curved arrow originates from the text and points towards the middle blade of the wind turbine in the foreground.

Offshore wind turbines

Wind turbines in the oceans catch strong winds. The power from the spinning blades is changed into electricity using a generator. This makes renewable energy (energy that does not run out when used) without using up other resources or polluting the oceans.
