

On thin ice

The ice sheets in Antarctica and Greenland are melting, which is one of the reasons for rising sea levels. In the Arctic, walrus and polar bears live on the ice, but it is disappearing quickly.

Ruined reefs

The world's largest coral reef is the Great Barrier Reef in Australia. Two-thirds of this reef, however, is now damaged by coral bleaching. This is devastating for all marine animals who depend on coral reefs for survival.

Flood risk

Bangladesh already has regular flooding. By 2050, the sea level is expected to rise by 20 in (50 cm). This means Bangladesh could lose about 11 percent of its land and pose a threat to nearly 15 million people who live in low-lying coastal regions.

Catastrophic coral

These coral reefs in the South China Sea are dying. Acidic waters are harmful to most shellfish, so there are fewer crabs and lobsters. This disrupts the ocean food chain since many marine animals eat shellfish.
