

Hubble has taken incredibly detailed images, such as this one of the death of a star.

Hubble is monitored by the Flight Operations Team (FOT) at the Goddard Space Flight Center in Greenbelt, Maryland, USA. The team use computers to constantly check all is running well.

The Hubble Telescope was designed in the 20th century.

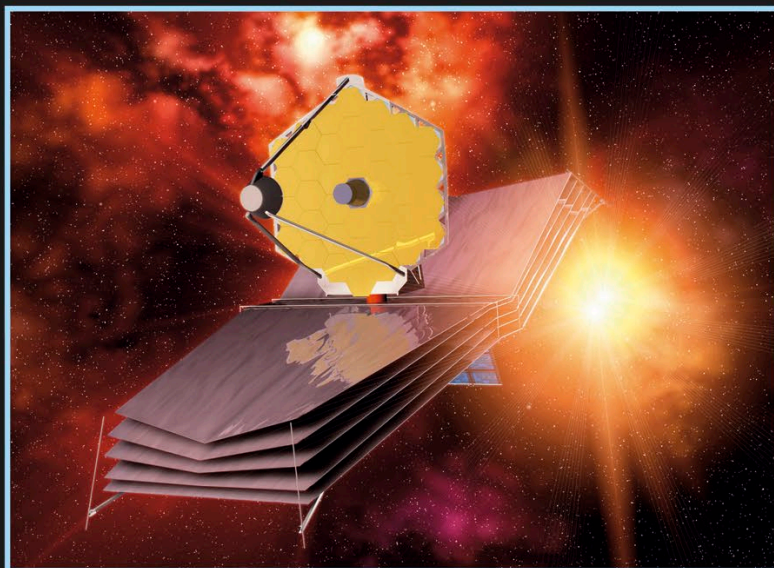

Hubble is about the size of a school bus.

Antenna used for sending and receiving signals from the Earth

Solar panels convert sunlight into electricity.

## An eye in space

Now we have telescopes in space, most famously the Hubble Space Telescope (HST). It orbits the Earth at a speed of around 28,000 kph (17,400 mph) and is controlled from the Earth.

The James Webb Space Telescope (JWST) is currently being planned to replace Hubble in 2018. It will see farther and more clearly than Hubble.
