

The southern sky

This star map shows some of the constellations in the southern hemisphere (that's anywhere south of the equator). Look up at the sky on a clear night. You might not be able to see all these stars all year round if you live close to the equator.

A star map of the southern sky

Imagine the Earth surrounded by a sphere of stars. The southern sky map is taken from the bottom half of that sphere.

They won't stay still!

As you begin star-spotting you will notice that the stars and constellations don't appear to be fixed in the same place. This is because the Earth's rotation makes the stars appear to move.

The stars' apparent movement shows clearly on a long exposure photograph of the night sky.
