

Space technology

Some of the inventions we use today are closely connected to the space program. Just take a look at the following.

A hand-held Dustbuster has super-suction power.

Cordless tools

Space scientists and power-tool designers together made cordless tools so astronauts could drill rocks on the Moon. This work led to the invention of cordless medical instruments and a cordless vacuum cleaner.

Surgeons use lightweight, battery-powered instruments.

Medical scans

Computer software, originally designed to enhance pictures of the Moon, is now used by medical staff. It makes scans of the human body easy to read so doctors can diagnose diseases.

Memory foam

This was developed to improve seating and crash protection for pilots. The foam moulds to the shape of the body, then returns to its original shape.

Memory foam is used here in a neck cushion.
