

Around and around

A multi-axis trainer helps astronauts get used to the out-of-control spinning feeling they'll get from tumbling in weightless conditions.

Walking on the Moon

In the 1960s, Apollo mission astronauts would practice moon-walking by moving along a wall while suspended at an angle by heavy cables. Such training took place at NASA's Lunar Landing Research Facility in Virginia, USA in a Reduced Gravity Walking Simulator, such as the one here.

Weightless wonder

Flown in a special way, an aeroplane with no seats and padded walls helps astronauts get used to feeling weightless. This plane is known as the "vomit comet" because its motion makes people feel sick.
