

A safe journey

Astronauts carry safety equipment in case of emergency.

Life rafts are used if the crew have to crash land at sea.

Sea dye is used to colour water after an emergency landing to alert rescuers.

Astronauts must **drink** fluids regularly to prevent dehydration.

Astronauts carry **chemical lightsticks** with them in the pocket of their suit.

Chill-out time

Inside their craft, astronauts wear clothes they would wear on the Earth, such as shorts and a T-shirt. Clothes are not changed as often as they would be on the Earth – after all, there are no washing machines on board a space station!

Just popping out

Extravehicular mobility units, or EMUs, are a bit like miniature spaceships. They provide astronauts with all they need to survive. They are used for working outside a spacecraft such as the International Space Station.

An astronaut needs to work outside to repair satellites, or check the outside of the spacecraft.
