

Apollo 11 reached the Moon because of a huge rocket called *Saturn V*. Most of *Saturn V* contained the fuel needed to blast it into space. Three astronauts sat in a tiny capsule at the top of the rocket.

Moon journey

During the 1960s there was a race between the USA and the former Soviet Union to put a human on the Moon. The USA succeeded by landing the first humans on the Moon with *Apollo 11* in 1969.

10 The service module is ejected before re-entry into the Earth's atmosphere.

Service and command modules

The journey back

11 The command module is the only part of the mission to return to the Earth.

1 Five F1 engines blast the *Saturn V* rocket into space from the Kennedy Space Center.

The journey out

3 The command and service modules separate from the rocket and perform a 180° turn.

Re-entering atmosphere

The service module contained the power and life-support systems.

2 The rocket's engines fire to set the craft on a course to the Moon.

What was Apollo 11?

Apollo 11 was the first manned mission to land on the Moon. It was made up of three modules, or parts: the tiny command module, the service module, and the lunar module.
