

Third rock from the Sun

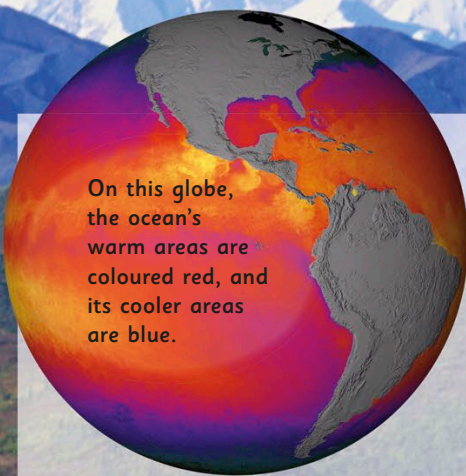

Our home planet, the Earth, is the only one in the solar system capable of supporting life as we know it. It's the right temperature because it's neither too close to the Sun, nor too far from it.

Take a deep breath

The Earth is surrounded by an atmosphere made up of gases – mostly nitrogen and oxygen, with traces of carbon dioxide and other gases mixed in.

The Earth is the third planet from the Sun. It takes 365.25 days to orbit the Sun.

A warm blanket

The Earth's atmosphere and oceans play a crucial role in keeping its temperature stable. They absorb the Sun's heat and move it around the planet. This helps keep the temperature suitable for life.
