

King penguin

Kakapo

Rhea

Takahe

Brown kiwi

Cassowary

Rheas are five feet (1.5 meters) tall, weigh more than 45 pounds (20 kilograms), and live in South America.

Rheas peck the ground with their big, flat beaks to snap up grass, seeds, and leaves.

These frilly feathers keep the rhea warm at night.

By spreading its wings out like a sail, the rhea can catch the wind and run even faster.

Males wave their skinny, bare necks from side to side to attract a female.

Come to daddy

Rheas are unusual. The males, not the females, incubate the eggs and look after their big babies for up to five months.

Cassowary foot

Ostrich foot

Running "shoes"

The ostrich is the only bird to have two toes; most birds have four.

Running birds have massive, muscular legs.

The bones inside their legs are solid. Rheas don't fly, so they do not need lightweight bones.

Three front-facing toes.

Rheas look shaggy because the barbules on their feathers do not "zip together." Flightless birds do not need neat feathers.
