

CATS

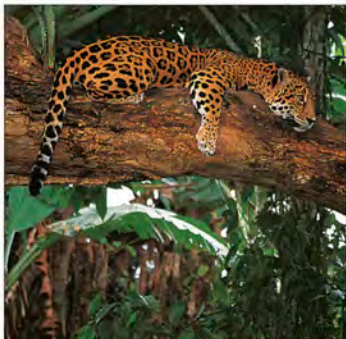

A cheetah can accelerate as quickly as a Ferrari car.

Cats are carnivores. Most creep up on their prey by sneaking slowly and silently through the undergrowth. Then, suddenly, they will hurl themselves onto their surprised victim. The sharp canine teeth quickly deal the deadly blow. The biggest cat of all, the striped tiger, can eat 55 pounds (25 kilograms) of meat in a meal! Its appetite is almost matched by the majestic lion, the biggest cat and most powerful hunter in Africa.

Tigers

Aerial ambush

All cats climb trees. This spotted jaguar is waiting to drop down on a passing peccary or tapir. It will even tackle alligators.

Bright eyes

When light shines on a cat's eyes, they glow like the reflectors on the back of a bike. This happens because the light bounces back off a special layer in the cat's eyes. This layer collects light. It helps cats see six times better than you in dim light.

Grassland queens

Lions are the odd-cats-out because they live in groups, called prides. Male lions are often called the "Kings of the Jungle," but they do not live in jungles, and the females, or lionesses, do most of the hunting.
