

Frightened

Angry

Not a word

The chimp is one of the few mammals that can make faces to show its feelings.

Holding hands

You can pick up things because you are able to fold your thumb across your hand.

Like you, apes have sensitive hands.

Apes and monkeys have these useful, "opposable" thumbs, too.

Is it a bird?

Every night, orangs build a cozy nest to sleep in. It takes just five minutes to build a mattress of branches and a blanket of leaves.

Baby gorillas learn to crawl at nine weeks, climb at six or seven months, and walk at eight months. They may live to be forty.

Male gorillas stand up to 6.5 feet (two meters) tall. They live in Africa.

An orangutan's big toes can grip things, too!

Big brain

Gorillas have about the same number of hairs as you. They look hairier because their hair is long and thick.

Apes see things in color—just like you.

All apes can sit and stand up straight.

Gorillas can climb trees, but they spend most of the day relaxing on the ground.
