

THE HORSE FAMILY

Almost all the horses in the world are tame. The only wild species left is the Przewalski's horse. It survives in zoos. The most common wild member of the horse family today is not

Przewalski's a horse, but a zebra.
horse

Fast, striped zebras are herbivores—they chew grass with their flat back teeth. Horses, zebras, and asses walk on the tips of their toes, which are hidden inside hard “shoes,” called hooves.

The ears twist around to listen for danger.

Plains zebras are up to 5 feet (1.5 meters) tall at the shoulder. They live in Africa.

Best friends

Zebras and wildebeest like to live together.

The zebras keep watch, while wildebeest sniff the air for lions.

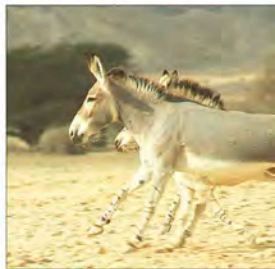

Wildebeest eat the short grass left by the zebras.

A zebra's mane stands up straight.

The hoof is just a large toenail!

Foals can walk when they are a few minutes old.

Desert “donkeys”

Wild asses are shy and rare. They live in the dry North African deserts.
