

The ears and nostrils can be pressed flat to keep out sand.

Two rows of eyelashes keep out sand and stop their eyes from freezing on cold desert nights.

A camel doesn't waste water. Liquid from its runny nose drips down the split lip into its mouth!

Camels spit at things that annoy them.

Tough lips can grip thorny desert plants.

Camels hardly ever sweat. This saves water.

Camels roll from side to side when they walk because they lift both legs on one side at the same time.

The two toes spread out to stop the camel from sinking into soft sand.

King of the castle

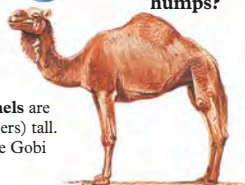

While the females graze, the male vicuña stands on a rock. If it spots a mountain lion, it whistles and the fleecy females flee.

Hardworking mammals

Llamas and alpacas have been bred by people from wild guanacos. Llamas are milked and used to carry heavy loads. Alpacas are kept for their fine wool.

How many humps?

Bactrian camels are 7 feet (2.2 meters) tall. They live in the Gobi desert in Asia.
