

Tunnel of lava

Caves are found in rocks other than limestone. This one is made of lava and is inside a volcano in Hawaii.

Cracks in the rock are widened when rainwater seeps along them.

Limestone pavements are made when the rock dissolves along joint lines.

Caving in

Sometimes a cave turns into a gorge. This happens when the roof falls in to reveal underground caverns and, far below, the river that carved them.

Going up

Where water drips onto the cave floor, columns of calcite, called stalagmites, grow upward.
