

Before it is ground, this ear of corn will be beaten to separate the grains from the husk.

The grain was ground between two heavy stones and made into flour.

Coiling clay

This girl is making a pot by coiling long, thin rolls of clay on top of a flat clay base. She is making a pot in the same way the first potters did, 9,000 years ago.

The flour would be mixed with water and made into round, flat loaves.

From farm to town

Farms attracted people. As they grew larger, villages and towns were formed. The first known town, Çatal Hüyük, was built in Turkey about 9,000 years ago.

The roofs were made of branches, reeds, and straw covered in mud.

The houses touched each other and there were no streets.

The walls of the houses were made of mud. They only had a few windows.

People got into their houses by climbing a ladder and going through a hole in the roof.
